

REV	DESCRIPTION	DATE	BY
P1	Making sketch for the prototype build plan	2026-10-01	AC

READS

Folder layout of a portfolio repository

Controlled-document template

License texts (MIT; CERN-OHL-S v2)

THE MODULE AND THE PARTS INSIDE IT

Template repository and CI workflow

Package skeleton with a version number

Per-repository stub, about 47 kB

CI workflow: check on every push

Release job: PDFs on a document tag

HANDS ON

A new repository, ready to check

A pass or fail on every push

PDFs attached to a release

WHERE IT GOES

This module's object in colour, the rest of the kit in grey

HOW TO MAKE IT AND HOW IT FITS

Make it first, so every later module is checked by CI from day one.

1. Start an empty package with a version number and a license file.
2. Copy the folder layout of a finished repository into the template: docs, cad, bom, media, the license files and the citation file.
3. Write the stub: the version pin, the identity file, the agent rules and commands, and a copy of the standard. No code, no fonts.
4. Write the CI workflow: check on every push and pull request with the core install; render and publish PDFs on a release tag only.

Fits: the stub is the only kit content inside a repository (joint 6); the check job reads the checker's exit code (joint 2).

Check: the template repository passes the check before any other module exists (an empty TRL 1 project with its problem statement).

SIZES THAT MATTER

Stub in each repository: about 47 kB (today 1.20 MB of kit)

Check job installs the core only: about 5 MB

Release job installs every extra: about 1.1 GB

INTERFACE VIEW

What the module reads, the parts inside it and what it hands on; not to scale
